Day 06 - User Challenge

Today's challenge is a fun one. All you need to do is tell a silly story using variables. You can copy the example below or you can come up with your own. The only requirement is that you use at least four variables. In my example below I used <name> rather than the correct format for an f-String. That is all part of the challenge. Replace all the <> with the correct formatting.

You might also notice something super cool my example below. I wrote my story (an fstring) and assigned it to a variable called "our_story", then on line 12, all I needed to do is print the variable. How cool is that?

```python
name = ""
place = ""
color = ""
number = ""
our_story = f"""Once upon a time <name> wanted to leave <place> in search of a
magic adventure! <name> wanted to collect <number> <color> crystals of hope.
Soon <name> found <number> of <color> crystals but on the way home... alas...
one crystal fell out of our adventures bag and only <number - 1> <color>
crytals name it back.
"""

print(our_story)
```

Well done on making it this far! Tomorrow is going to be a very relaxed recap day. We are going to recap everything we've done so far as well as learn about comments.

Good luck on today's the challenge and I will see you tomorrow!
